Report Overview

Spinal Decompression Devices are medical equipment designed to alleviate pain and discomfort associated with various spinal conditions, such as herniated discs, degenerative disc disease, and sciatica. These devices work by applying controlled, distraction forces to the spine, which helps to create a negative pressure within the intervertebral disc. This negative pressure facilitates the retraction of the bulging or herniated disc material, thereby reducing pressure on the nerves and promoting healing. Spinal Decompression Devices can be categorized into two main types: mechanical and non-mechanical. Mechanical devices, such as the DRX9000, use a motorized table to apply the distraction force, while non-mechanical devices, like the Inversion Table, rely on the patient's body weight and gravity to create the necessary force. These devices are often used as a non-surgical treatment option for spinal conditions and are typically used in conjunction with other therapeutic modalities, such as physical therapy and pain management.
