### Report Overview:

Demineralized bone matrix (DBM) is allograft bone that has had the inorganic mineral removed, leaving behind the organic "collagen" matrix. It was first discovered by Marshall Urist in 1965 that the removal of the bone mineral exposes more biologically active bone morphogenetic proteins. These growth factors modulate the differentiation of progenitor cells into osteoprogenitor cells, which are responsible for bone and cartilage formation. As a result of the demineralization process, DBM is more biologically active than undemineralized bone grafts; conversely the mechanical properties are significantly diminished.

The Global Spinal Machined Bone Allograft Market Size was estimated at USD 554.14 million in 2023 and is projected to reach USD 685.14 million by 2029, exhibiting a CAGR of 3.60% during the forecast period.
