## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Spindle Units competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The spindle unit is the unit that directly drives the tool or workpiece to rotate during CNC machine tool processing, and performs cutting, grinding and other processing procedures. It is an assembly that includes the spindle and other accessories such as bearings, tool holding systems, etc. According to the driving mode, the main shaft unit can be divided into: gear type, belt type, direct connection type and built-in type. The spindle motor and the tool run at high speed to improve the processing efficiency. The motor rotor directly serves as the main shaft of the machine tool. The shell of the spindle unit is the base of the motor, and other components are used to fulfill the integration of the motor and the spindle of the machine tool. Driven by the policies of smart manufacturing and green manufacturing, the demand for spindle units continues to grow, especially in the fields of precision machining of battery housings for new energy vehicles, lightweight material cutting for aerospace, and high-cleanliness machining of semiconductors. The demand for high-speed, high-precision, and high-rigidity spindles has surged. At the policy level, "Made in China 2025" explicitly requires that the localization rate of mid-to-high-end spindles exceed 80% by 2025, releasing policy dividends for local companies and stimulating investment potential in innovative tracks such as ceramic bearing spindles and milling and lathe systems.

The global Spindle Units market size was estimated at USD 473.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.60% during the forecast period.
