## Abstracts

A spine endoscope is a medical device used in minimally invasive spinal surgery. It is a small, flexible instrument with a camera and light source that allows surgeons to visualize and access the spine with minimal incisions. The endoscope aids in procedures such as discectomy, spinal fusion, and the treatment of herniated discs, allowing for quicker recovery times and reduced patient discomfort. **Market Drivers:** The increasing demand for minimally invasive surgery (MIS) is a major driver for the growth of spine endoscopes. Patients prefer minimally invasive procedures due to shorter recovery times, reduced pain, and fewer complications. Additionally, the rising prevalence of spinal disorders such as degenerative disc disease, scoliosis, and spinal stenosis is fueling market growth. **Market Opportunities:** The global increase in aging populations, who are more prone to spine-related issues, presents a significant opportunity for the market. Technological advancements in endoscope design, including improved imaging, flexibility, and smaller instrument sizes, are also driving innovation in spine surgery. Emerging markets with growing healthcare infrastructure offer potential for market expansion. **Market Challenges:** One of the challenges in the market is the high cost of spine endoscopes and the need for specialized training for surgeons. Additionally, there is competition from other minimally invasive spinal surgery technologies, such as robotic surgery systems, which may limit market growth in certain regions.

The global Spine Endoscope market size was estimated at USD 70.9 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
