Abstracts

Spinning Disk Confocal Microscopy (SDCM) is an advanced optical imaging technique that enhances the clarity and resolution of fluorescent imaging. It employs a disk with multiple pinholes that rotate at high speed to scan and capture fluorescence from the specimen. This method allows for the acquisition of high-resolution, real-time images with reduced photobleaching and phototoxicity compared to traditional single-point laser scanning confocal microscopy. Spinning disk confocal microscopy is most often used for live-cell samples, as less damage is done to the sample through photobleaching and so changes in the sample can be viewed over time. Spinning disk confocal microscopy overcomes several weaknesses of conventional fluorescence microscopy, including removing out of focus light and using optical sectioning to construct 3-dimensional models from 2-dimensional image slices. Researchers are increasingly looking to combine SDCM with super-resolution microscopy techniques like STORM (Stochastic Optical Reconstruction Microscopy) or PALM (Photoactivated Localization Microscopy). This integration allows for higher resolution imaging while maintaining the speed and reduced photodamage benefits of SDCM. The spinning disk confocal microscopy industry has high technology barrier and dominated by a few suppliers. There are more expected new entrants in the future due to promising demand, which will lead to intensified competition. The spinning disk confocal microscopy industry has high technology barrier. Globally, key suppliers of spinning disk confocal microscopy include Evident, Nikon, Oxford Instruments Andor. In addition, due to the operation complexity of the system, skilled persons are needed, which limits the usage of spinning disk confocal microscopy as well. There is growing interest in real-time live-cell imaging, driven by advances in biological research, particularly in fields like cancer research, neuroscience, and developmental biology. Spinning disk confocal microscopy is favored due to its ability to provide fast imaging with low phototoxicity, making it ideal for observing live cells over extended periods. With the fast development of related

industries, such as cell biology, demand of spinning disk confocal microscopy will continue to increase with promising market potential.

The global Spinning Disk Confocal Microscopy (SDCM) market size was estimated at USD 127.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.00% during the forecast period.
