Abstracts

Spinning Disk Confocal Microscopy (SDCM) is an advanced optical imaging technique that enhances the clarity and resolution of fluorescent imaging. It employs a disk with multiple pinholes that rotate at high speed to scan and capture fluorescence from the specimen. This method allows for the acquisition of high-resolution, real-time images with reduced photobleaching and phototoxicity compared to traditional single-point laser scanning confocal microscopy. Spinning disk confocal microscopy is most often used for live-cell samples, as less damage is done to the sample through photobleaching and so changes in the sample can be viewed over time.

The global Spinning Disk Confocal Microscopy Sdcm market size was estimated at USD 126.72 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 11.00% during the forecast period.
