Report Overview

Split air source heat pump is a heating and cooling system that extracts heat energy from the outdoor air and transfers it to the indoor space for heating purposes. It utilizes a compressor and refrigerant to absorb heat from the outside air, which is then circulated through coils and released into the indoor area. In summer, the same system can be reversed to provide cooling by extracting heat from the indoor air and releasing it outdoors. The split design refers to the separation of the indoor and outdoor units, with the indoor unit responsible for dispersing conditioned air throughout the space.
