Report Overview

Split ball valve is a commonly used pipeline valve, usually used to control the flow of fluid medium. It consists of valve body, ball, stem and sealing ring and other components. Unlike the one-piece ball valve, the body of the split ball valve is divided into two parts, usually a ball cut in half in the middle, each part has a flange and is fastened together with bolts. This design facilitates the disassembly and maintenance of the ball, and can adapt to different media and working conditions by changing the material of the valve body and the ball. Split ball valves are widely used in fluid control systems in petroleum, chemical, metallurgy, electric power and other industries.
