## Abstracts

The split influenza vaccine is a type of inactivated influenza vaccine produced by chemically disrupting the virus structure to separate viral components, primarily surface antigens such as hemagglutinin and neuraminidase, while eliminating the viral nucleic acid to ensure non-infectivity; this process enhances safety by reducing reactogenicity compared to whole-virus vaccines while retaining immunogenicity, making it suitable for a broad population including children and older adults, and it is administered via intramuscular injection to stimulate a protective immune response against seasonal influenza strains.

The global Split Influenza Vaccine market size was estimated at USD 4102.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.75% during the forecast period.
