Report Overview

Spray deodorization equipment is suitable for the treatment of low-concentration air volume in confined spaces or odors that are open and cannot be collected in a closed manner. It can perform efficient and specific removal according to the characteristics of odor components. Good deodorant agents are pressurized and sent to high-pressure nozzles for atomization through high-pressure pipelines. Micron-sized particles are formed, and the ultra-fine mist particles diffuse rapidly in the air, thereby absorbing and treating odor components. This equipment adopts the plant liquid agent developed by Xinlin itself, and the debugging period is short. The equipment has low operating cost, no secondary pollution, high removal rate, wide application range of odor, can purify multiple pollutants at the same time, and is widely used in odor treatment in various occasions.

The global Spray Deodorization Equipment market size was estimated at USD 185.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
