Abstracts

Spraying corn husk powder, also known as sprayed corn husk or corn bran, is a feed ingredient with high nutritional value produced during corn processing. In the production of edible corn starch or alcohol, after the corn is wet-soaked, its cortex is separated to form corn husks. Then, corn slurry (concentrated corn soaking liquid) with high protein and energy content is sprayed onto the corn husks, and then dried to make slurry corn husks powder. Through shotcrete treatment, the protein content in corn husks is significantly increased. Generally, the crude protein content can reach 16%-22%, which can provide a rich nitrogen source for animals. At the same time, a large amount of fiber in corn husks is retained, which helps promote intestinal peristalsis in animals and maintain normal digestive functions. However, excessive use may affect the overall digestibility of the feed. Its energy level is also increased due to the addition of corn steep liquor, which can provide energy for animal growth. It also contains some vitamins, minerals, amino acids and other nutrients to make the nutrition more balanced. Spraying corn husk powder is mainly used in the feed industry and is an ideal feed product. It is widely used in ruminant animal breeding, which can promote ruminant animals to show better production performance; it can also be used in poultry feed, but generally the amount added should not be too much; in pig feed due to high mycotoxins and poor palatability, etc. For some reasons, its use is subject to certain restrictions.

The global Spraying Corn Husk Powder market size was estimated at USD 961.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.90% during the forecast period.
