### Report Overview:

Spread spectrum is a technique in which the clock frequency is slightly adjusted to reduce the peak energy generated by the clock. The use of spread-spectrum clocking techniques reduces the EMI of the clock-generated fundamental frequency and subsequent resonances, thereby reducing the EMI of the overall system. The Spread Spectrum Clock Generator (SSCG) products support two different types of spreading: Down Spread and Center Spread. Downspread is adjusted below the nominal clock frequency, and center spread is adjusted evenly above and below the nominal clock frequency. The type of spread spectrum used depends on the specification of the clocking target. Some target chipsets, CPUs, etc. have a maximum clock frequency specification that cannot be violated. In these cases, down-spread should be used.

The Global Spread Spectrum Clock Generator Market Size was estimated at USD 433.93 million in 2023 and is projected to reach USD 643.95 million by 2029, exhibiting a CAGR of 6.80% during the forecast period.
