### Report Overview

A safety device is designed to protect a pressurized vessel or system during an overpressure event. An overpressure event refers to any condition which would cause pressure in a vessel or system to increase beyond the specified design pressure or maximum allowable working pressure (MAWP). The primary purpose of a pressure relief valve is protection of life and property by venting fluid from an overpressurized vessel. The spring-loaded pressure relief valve is a conventional pressure relief valve that is commonly used in liquid service valves. The valve opens proportionally as the pressure increases to overcome the spring pressure.
