Report Overview

Spunbond nonwovens are fabric-like materials made from long filaments of synthetic polymers, such as polypropylene, polyester, or polyethylene, which are extruded, stretched, and bonded together without weaving or knitting. These materials are characterized by their strength, durability, breathability, and resistance to moisture, making them ideal for a wide range of applications, including hygiene products (diapers, sanitary napkins), medical supplies (surgical masks, gowns), agriculture (crop covers), geotextiles, and automotive interiors. The production process involves spinning molten polymer into continuous filaments, laying them into a web, and bonding them mechanically, thermally, or chemically, resulting in a lightweight yet strong fabric with customizable properties such as softness, filtration efficiency, or barrier performance. Spunbond nonwovens are favored for their cost-effectiveness, versatility, and eco-friendly potential, as some variants are recyclable or biodegradable, aligning with increasing sustainability demands in global markets. The industry continues to innovate with hybrid technologies (e.g., spunbond-meltblown-spunbond or SMS composites) to enhance functionality for specialized uses.

The global Spunbound Nonwovens market size was estimated at USD 16402.02 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
