## Abstracts

Square clarifiers are a type of equipment used in water treatment processes, mainly for solid-liquid separation, especially in the fields of sewage treatment, industrial wastewater treatment and drinking water treatment. They use the principle of gravity sedimentation to settle suspended solids in the clarifier, thereby achieving the separation of clean water. Square clarifiers usually include one or more square water tanks, which are equipped with water inlet, water distribution system and mud bucket. The water to be treated enters the clarifier through the water inlet pipe and is evenly distributed throughout the water tank with the help of the water distribution system. Suspended solids settle to the bottom of the pool due to gravity, and clean water overflows from the top of the pool or flows out through the outlet pipe.

The global Square Clarifiers market size was estimated at USD 440.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
