The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Square Sodium-ion Battery Cell competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A prismatic sodium-ion battery cell is a secondary battery unit encapsulated in an aluminum shell and featuring a stacked or wound internal structure. Energy storage and release is achieved by the intercalation and extraction of sodium ions (Na⁺) between the positive and negative electrodes. The positive electrode material is typically a layered oxide, polyanionic compound, or Prussian blue-based compound, while the negative electrode is often made of hard carbon material. The electrolyte is an organic solvent system containing sodium salts. This cell offers advantages such as structural stability, high assembly efficiency, excellent heat dissipation, and a long cycle life. It is currently one of the primary forms of sodium-ion battery industrialization and is widely applicable in energy storage power stations, low-speed electric vehicles, and backup power sources. It boasts abundant resources, low costs, and high safety. By 2024, global production of square sodium-ion battery cells will reach 1,531.58 MWh, with an average selling price of \$77 per kilowatt-hour.

The global Square Sodium-ion Battery Cell market size was estimated at USD 119.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.40% during the forecast period.
