Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Stabilized Chlorine Dioxide competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Stabilized chlorine dioxide is a formulated source of chlorine dioxide that stores sodium chlorite in a buffered medium and releases chlorine dioxide upon activation. Its primary role is to deliver a controllable oxidizing biocide into water and onto surfaces with lower operational risk than in situ gas generation, while enabling standardized packaging, shelf stability, and quality assurance. Upstream inputs include sodium chlorite solutions, stabilizers, and compliant packaging from small packs to drums and IBCs. Downstream users are drinking-water operators, airlines and MRO organizations, hospitals and laboratories, food and beverage plants, and industrial facilities managing biofilm. Procurement typically combines approved-vendor programs and annual frameworks for water systems with channel purchases for small packs. Gross margins commonly fall in the twenty to thirty percent band, supported by qualification costs, regulatory documentation, and switching frictions in safety-critical environments. In the current market, global production is around 58.5 thousand tons, with an average selling price of about 5.1 thousand USD per ton on an EXW basis. Europe constitutes the single largest demand region in the base year given the strong presence of medical device disinfection and water programs, anchored by well-documented brands and products. Supply is led by chemical formulators and brand owners of stabilized solutions and stabilized precursors; buffered sodium-chlorite solutions at 2 percent available chlorine dioxide remain the most widely traded form, complemented by low-alkalinity liquid precursors and tabletized systems for small or remote installations. Concentration is moderate to high with a handful of suppliers controlling the bulk of revenue, reflecting long qualification cycles, stewardship

requirements, and channel advantages across aviation, healthcare, and municipal water end-uses. From 2025 to 2031, steady expansion is expected as hygiene standards tighten in public infrastructure and as attention to Legionella and biofilm management remains elevated. Economics will track chlor-alkali and sodium-chlorite availability, packaging optimization, and distribution scale. Bottlenecks include approval lead times, transport and storage constraints for oxidizing liquids, and the need for robust safety dossiers for aircraft and hospitals. Technology iteration is likely to emphasize safer low-alkalinity precursors, controlled-release media that reduce handling error, and digital dosing or monitoring bundles offered through professional channels. Capacity additions should follow verified downstream conversions rather than lead them, supporting disciplined supply and stable pricing around the current EXW level with mix shifts by package size and application.

The global Stabilized Chlorine Dioxide market size was estimated at USD 298.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the forecast period.
