Report Overview

Stable isotope mass spectrometer refers to a mass spectrometer (IRMS) specially designed to measure the ratio of stable isotopes such as C, H, O, N and S. In the stable isotope analysis of light elements, mass spectrometry is carried out in the form of gas, so the sample to be analyzed must be converted into gas first. In the ion source, gas molecules are ionized into positively charged ions, and the ions are separated according to their mass-to-charge ratios by the action of electric and magnetic fields, and then the stable isotope ratio is determined according to the intensity of different ion beams.
