## Abstracts

The stacker stereoscopic warehouse is an efficient and automated warehousing system, which is mainly composed of stackers, stereoscopic shelves, control systems and conveying systems. Its core function is to quickly store and retrieve goods in the stereoscopic warehouse through automated stackers, so as to achieve high-density and low-cost cargo storage. The working principle of the stacker stereoscopic warehouse is that the stacker automatically selects the cargo storage location and performs the storage and retrieval operation according to the instructions of the warehouse management system (WMS) or the warehouse control system. It moves quickly between the shelves through the lifting mechanism, the transverse mechanism and the longitudinal movement mechanism to store the goods on different shelves or take them out from the shelves. The stereoscopic shelf system is usually densely arranged, which can achieve very efficient storage and adapt to the high-frequency material handling needs. Compared with the traditional manual handling method, the stacker stereoscopic warehouse not only greatly improves the utilization rate of storage space, but also reduces the error and time cost of manual operation.

The global Stacker Stereoscopic Warehouse market size was estimated at USD 2245.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.70% during the forecast period.
