## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Staining Antioxidants with Antiozonant Effect competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Staining antioxidants with antiozonant effect are a class of rubber additives that combine antioxidant and antiozonant functionalities, primarily designed to prevent ozone-induced cracking in rubber products. These additives are typically amine-based compounds, especially diaryl amine derivatives, known for their high reactivity and ability to migrate to the rubber surface, where they form a protective layer to neutralize ozone. Their conjugated molecular structures allow them to react readily with oxygen and ozone, thereby scavenging free radicals and halting chain degradation reactions. However, due to their staining nature, they are not suitable for light-colored or transparent rubber products. These antioxidants are widely used in dark-colored rubber applications such as tires, conveyor belts, and seals, significantly enhancing durability and weather resistance.

The global Staining Antioxidants with Antiozonant Effect market size was estimated at USD 1458.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the forecast period.
