A Stand Entry Guidance System (SEGS) is an advanced ground-based navigation and docking technology designed to assist pilots in precisely maneuvering and positioning aircraft at airport gates or parking stands, replacing traditional manual visual guidance from marshallers. These systems typically employ a combination of laser, infrared, or visual sensors to detect the aircraft's approach angle, alignment, and distance relative to the stand, providing real-time feedback to the cockpit via visual displays or data link communications. By automating the docking process, SEGS enhances operational safety, reduces the risk of ground collisions or wingtip damage, improves turnaround efficiency by minimizing docking time, and decreases reliance on human marshallers, especially in adverse weather conditions or low-visibility scenarios. Such systems are increasingly integrated with Airport Collaborative Decision Making (A-CDM) platforms and are a key component of smart airport infrastructure, aligning with industry trends toward automation and digitalization in ground handling operations.

The global Stand Entry Guidance System market size was estimated at USD 68.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
