## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Standard Infrared Calibration Source competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The radiation calibration source is an infrared radiator with a constant or variable temperature, which is used to adjust and calibrate the temperature scale in high temperature measurement systems, thermal imaging systems, heat flow measurement systems and spectral analysis systems. According to the mode of the calibration source, the single-point or multi-point temperature of an infrared detector and the temperature curve can be detected and recorded. Radiation calibration sources are developing towards high precision, multi-spectrum, portability and environmental protection, especially in the fields of medicine, industry and nuclear power, where the demand is becoming increasingly diversified. The new generation of calibration sources pays more attention to stability and digital matching, and some alternatives such as X-ray calibration systems are gradually emerging to reduce the dependence on radioactive isotopes and meet increasingly stringent regulatory requirements. In terms of price, traditional radioactive calibration sources such as Cs-137 and Co-60 generally range from \$5,000 to \$150,000 depending on the activity and packaging; while high-end X-ray adjustable calibration systems may cost more than \$300,000. The price will also be affected by factors such as activity level, regulatory approval, and whether it is equipped with an automatic calibration platform.

The global Standard Infrared Calibration Source market size was estimated at USD 1624.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
