Report Overview

Stand piezometers are instruments used to measure and monitor the pressure or water level in groundwater wells or boreholes. They consist of a PVC stainless steel pipe with perforations along its lower section to allow groundwater to enter the piezometer. The upper section of the pipe is typically connected to a pressure gauge or transducer, which provides readings of the groundwater pressure. The main purpose of standpipe piezometers is to determine the groundwater level and its fluctuations over time. They are commonly used in geotechnical and environmental engineering applications to assess subsurface conditions, evaluate the stability of structures, and monitor groundwater behavior during construction or remediation projects.
