Abstracts

Stannous chloride anhydrous is an inorganic compound with the chemical formula SnCl?, consisting of tin in its +2 oxidation state bonded to two chlorine atoms and characterized by the absence of water molecules in its crystalline structure. It is typically produced as a white crystalline solid, though it may appear yellowish due to partial oxidation, and is highly hygroscopic, readily absorbing moisture from the air to form hydrates. This compound serves as a versatile reducing agent and a key precursor in numerous industrial processes, including electroplating, where it facilitates the deposition of tin onto various substrates; glass manufacturing, acting as a reducing agent and colorant; and chemical synthesis, where it participates in reactions such as the reduction of nitro compounds and the formation of organotin derivatives. Its applications extend to the pharmaceutical industry as a reagent, the food industry as a preservative and antioxidant in certain contexts, and the electronics sector for tin plating components.

The global Stannous Chloride Anhydrous market size was estimated at USD 460.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
