Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Star Block Copolymers competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Star block copolymers are a class of branched polymers composed of several linear block copolymer arms radiating from a central core or junction point. Each arm consists of two or more chemically distinct polymer blocks (e.g., A-B or A-B-A structures), and all arms are covalently connected to the central core, forming a star-like architecture. This unique molecular geometry imparts properties that differ significantly from their linear counterparts, including lower viscosity, enhanced phase separation, and improved mechanical and thermal properties. Star block copolymers are used in applications such as adhesives, drug delivery, thermoplastic elastomers, and nanostructured materials. Star block copolymers are gaining market traction due to their unique architecture, which imparts superior mechanical strength, thermal stability, and tunable properties suitable for diverse applications. Key market drivers include growing demand in drug delivery and biomedical devices, where their biocompatibility and controlled degradation are critical; increasing use in high-performance adhesives and elastomers for automotive and consumer goods; and rising interest in nanostructured materials for electronics, coatings, and optoelectronics. Additionally, the push for sustainable and lightweight materials in packaging and green composites further supports market growth, driving innovation in both synthetic and bio-based star block copolymers.

The global Star Block Copolymers market size was estimated at USD 1184.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
