Report Overview

Starch extraction hydrocyclone is a device used in the starch industry to separate starch from other components in a slurry or suspension. It operates based on the principle of centrifugal force, where the slurry is fed into the hydrocyclone and forced to spin rapidly. Due to the difference in density, the starch particles move towards the outer wall of the hydrocyclone, while the heavier components such as fibers or proteins move towards the center. The separated starch is then collected for further processing, while the remaining components are discharged.

The global Starch Extraction Hydrocyclone market size was estimated at USD 85.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
