## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Static Induction Thyristors competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Static Induction Thyristor output reached about 8.4 million units, with 10 million units of annual capacity. The average unit price is about USD 125, these devices achieved an average gross margin of 38%. Static Induction Thyristors (SITs) are high-power semiconductor switching devices characterized by their vertical structure and field-controlled current conduction, offering extremely fast switching speeds, low on-state voltage drop, and high current-carrying capability. They operate on the principle of a static induction effect where the potential barrier in the channel between the source and drain is modulated by a gate voltage enabling both normally-on and normally-off operation modes. SITs are mainly used in pulsed power systems, high-frequency inverters, induction heating, RF amplifiers, and laser or plasma drivers. The supply chain for Static Induction Thyristors begins with upstream raw materials such as high-purity silicon wafers and dopants (boron, phosphorus), proceeds through midstream processes including epitaxial growth, ion implantation, diffusion, and wafer metallization, and culminates downstream with module packaging, testing, and integration by OEMs in defense, industrial, and energy conversion systems.

The global Static Induction Thyristors market size was estimated at USD 1080.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
