Abstracts

Stationary Lead Acid (SLA) batteries are a type of rechargeable energy storage system designed for long-term, fixed applications where they remain in a single location and provide backup or standby power, characterized by their use of immobilized electrolyte—either absorbed in a fiberglass mat (AGM) or gelled—which makes them spill-proof, maintenance-free, and capable of operating in various orientations without leakage. These batteries are engineered for deep-cycle use with slow discharge and recharge rates, offering reliable performance in critical power backup scenarios such as uninterruptible power supplies (UPS), telecommunications infrastructure, emergency lighting, security systems, and renewable energy storage, where durability, cost-effectiveness, and operational stability are prioritized over high energy density.

The global Stationary Lead Acid (SLA) market size was estimated at USD 17200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
