Abstracts

A steam air mixing sterilizer is a specialized medical device designed for the high-level disinfection and sterilization of heat-sensitive medical instruments and materials by utilizing a controlled combination of pressurized steam and hot air. This method allows for efficient sterilization at lower temperatures compared to pure steam sterilizers, making it suitable for delicate equipment such as those with plastic components, optics, or electronic parts that could be damaged by excessive moisture or high heat. The process typically involves multiple phases, including pre-conditioning to remove air, injection of steam to achieve sterilization temperature, and post-sterilization drying with filtered hot air to ensure instruments are moisture-free and ready for immediate use. These systems are widely employed in hospitals, dental clinics, laboratories, and other healthcare settings where instrument turnover, safety, and material compatibility are critical.

The global Steam Air Mixing Sterilizer market size was estimated at USD 120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.15% during the forecast period.
