## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Steam Cooling Machine competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Steam Cooling Machine production reached approximately 112,293 units, with an average global market price of around US\$ 3528 per unit. Gross margin is about 44%. The cost is 1,975 usd. Production capacity 120,000 to 140,000 units. A Steam Cooling Machine is a device that uses steam as a heat source to achieve cooling or heating through a lithium bromide-water or ammonia-water absorption cycle. This system eliminates the need for an electrically driven compressor, efficiently utilizing industrial steam, waste heat, or district heating steam, and features energy saving, low noise, and environmental friendliness. In the industry chain, upstream suppliers include refrigerants, heat exchanger copper tubes, stainless steel materials, valves, and control systems; midstream manufacturers are responsible for complete machine production and system integration; and downstream applications include large commercial buildings, district cooling systems, waste heat recovery in chemical and pharmaceutical plants, and combined heat and power (CHP) systems in power plants. With its high energy efficiency and low carbon footprint, steam-fired absorption chillers are becoming an important component of energy-saving cooling solutions for industry and buildings.

The global Steam Cooling Machine market size was estimated at USD 396.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
