Report Overview

Steam Methane Reforming, or SMR, processes feedstocks, ranging from natural gas to light naphtha, mixed with steam to produce a hydrogen rich syngas effluent, with a typical H₂/CO ratio of 3:1 to 5:1. SMR based plants are most commonly used to produce a hydrogen product or a combination of a hydrogen stream and another syngas product. In an SMR based plant, a heated mixture of the hydrocarbon feedstock and steam flows through catalyst filled tubes within a fired furnace called a reformer. The report covers large and medium SMR with hydrogen production capacity ranging ranging more than 1000 Nm³ /hr.
