A steam separator is a device used to separate the liquid moisture (such as water droplets, oil droplets, etc.) carried by steam from steam. In industrial and thermal systems, steam often contains a certain amount of moisture. If this moisture is not separated, it may cause scaling of the inner wall of the pipeline, reduce thermal efficiency, damage equipment, and affect product quality. The purpose of the steam separator is to ensure the dryness and purity of the output steam, thereby improving the reliability and efficiency of the system.

The global Steam Separators market size was estimated at USD 3017.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
