Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Steel Antenna competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Steel sheet antenna (also known as metal stamping antenna or sheet metal antenna) is a metal structure antenna made of cold-rolled steel sheet, stainless steel or galvanized steel through stamping, bending, welding and other processes. Its core features are high strength, corrosion resistance, and excellent environmental adaptability. It uses the conductive properties of the metal sheet itself to achieve electromagnetic wave radiation and reception. It is commonly used in low-frequency bands (such as UHF, VHF) or high-power scenarios. Typical designs include monopole, dipole or curved surface reflection structure. Compared with PCB printed antennas or ceramic antennas, steel sheet antennas are more suitable for harsh environments (high temperature, high humidity, mechanical shock), but they are larger in size and are often used in vehicle-mounted communications, industrial equipment and outdoor base stations.

The global Steel Antenna market size was estimated at USD 471.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
