Abstracts

Steel fiber in underground applications refers to discontinuous, short-length steel filaments specifically engineered for incorporation into concrete or shotcrete mixes to enhance the structural performance of subterranean constructions such as tunnels, mines, caverns, and underground storage facilities. These fibers act as a secondary reinforcement system that improves toughness, impact resistance, crack control, and durability in challenging geotechnical environments where traditional rebar may be difficult to install or maintain. By dispersing uniformly throughout the concrete matrix, steel fibers help mitigate issues like spalling, shrinkage cracking, and seismic-induced damage, offering a more efficient and often cost-effective solution for stabilizing rock and soil in high-stress underground settings where long-term structural integrity is critical.

The global Steel Fiber In Underground market size was estimated at USD 1225.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
