Report Overview

A steel inner liner fiber wrapped bottle is a high-pressure gas cylinder that consists of two parts: a steel inner liner and a fiber wrapped composite material shell. The steel inner liner is the main container for gases, while the fiber wound composite shell is used to enhance the strength and stiffness of gas cylinders, while also reducing their weight. In the manufacturing process, fiber wound composite materials typically use high-strength materials such as carbon fiber or glass fiber, which are machine wound onto the cylinder casing and soaked and cured with resin to form a sturdy composite casing. This type of cylinder is usually used to store high-pressure gases, such as natural gas, hydrogen, oxygen, etc. Due to the high strength and stiffness of steel inner liner fiber wound bottles, they can store more gas in the same volume, thereby improving gas storage efficiency.

The global Steel Liner Fiber Wound Bottle market size was estimated at USD 485.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
