Report Overview

A mixing valve is a valve that mixes hot and cold water. In fact, the valves themselves can't be mixed, just pick up the cold water and hot water pipes and play a mixing role. There are two main types of mixing valves, one is the manual mechanical type and the other is the self-heating type. The former is the most widely used type at present. The structure of the mixing valve is not very complicated, but its effect is very significant. It is widely used in the field. The products are widely used in electric water heaters, solar water heaters and geothermal heating systems. Steel, tungsten carbide, duplex nickel, titanium and alloys are the most widely used materials for mixing valves. Due to greater flow control and corrosive media treatment applications in the chemical, water and wastewater treatment industries, high temperatures and steam are involved. Due to the huge demand for materials, the market for steel mixing valves will grow significantly.
