Abstracts

Steelmaking deoxidizers are chemical agents used to remove dissolved oxygen from molten steel during the steelmaking process, preventing the formation of defects such as porosity, inclusions, and embrittlement in the final product. Commonly used deoxidizers include aluminum, silicon, manganese, and calcium, often introduced in the form of ferroalloys or complex compounds, with selection depending on factors such as steel grade, oxygen content, and desired mechanical properties. The effectiveness of a deoxidizer is determined by its affinity for oxygen, the nature and behavior of the resulting oxide products, and its impact on the cleanliness and microstructure of the steel.

The global Steelmaking Deoxidizer market size was estimated at USD 1250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
