Report Overview

The steering valve is often used for hydraulic power steering of construction machinery. There is a small motor inside and a double action oil cylinder outside. With the help of the pilot working pressure, when pulling the steering wheel, the pilot pressure P is switched into the small motor through the movement of the raft core to reduce the strength of manually pulling the steering wheel. The steering operation is terminated, the valve core returns to the middle position and the power of the power assisted motor is cut off.
