### Report Overview:

OA is the most common degenerative joint disease. Its initial symptoms include loss of articular cartilage followed by progressive to joint stiffness, swelling, pain, and loss of mobility.

Stem cells are the body's raw materials — cells from which all other cells with specialized functions are generated. Under the right conditions in the body or a laboratory, stem cells divide to form more cells called daughter cells. These daughter cells either become new stem cells (self-renewal) or become specialized cells (differentiation) with a more specific function, such as blood cells, brain cells, heart muscle cells or bone cells. No other cell in the body has the natural ability to generate new cell types.

Most stem cells used for the experimental treatment of OA are adult MSCs.

Researchers can easily collect them from fat or bone marrow. MSCs are able to turn into cartilage, bone, muscle, tendon, ligaments, or fat, depending on the type of tissue that surrounds them. This is why researchers are studying MSCs in stem cell treatments for OA.

The Global Stem Cell Therapy for Osteoarthritis Market Size was estimated at USD 28.05 million in 2023 and is projected to reach USD 107.53 million by 2029, exhibiting a CAGR of 25.10% during the forecast period.
