Abstracts

Stemless shoulder implants are a type of orthopedic prosthesis used in total shoulder arthroplasty that differ from traditional stemmed implants by eliminating the intramedullary stem, instead anchoring directly to the humeral head through metaphyseal fixation using features such as central screws, trabecular metal cones, or press-fit designs. This design aims to preserve bone stock, reduce stress shielding, simplify revision surgery, and potentially offer a more anatomical reconstruction, making it particularly suitable for younger, more active patients or those with adequate bone quality.

The global Stemless Shoulder Implant market size was estimated at USD 350.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
