Report Overview

The aortic aneurysm stent system is a medical device used to treat aortic aneurysms. Aortic aneurysm refers to the localized dilation or weakening of blood vessels in the wall of the aorta, forming a tumor-like protrusion. This condition can lead to aortic rupture, bleeding, blood clots, or other serious complications. The aortic aneurysm stent system is treated through interventional surgery. It consists of a metal stent and a membrane that prevents blood clots from forming. During surgery, a stent is placed into the aortic aneurysm to strengthen the aortic wall and prevent further expansion of the aorta. At the same time, the membrane blocks blood from entering the aortic aneurysm, reducing the risk of rupture and bleeding. The aortic aneurysm stent system can be implemented through guidewire guidance, vascular cannulation and other operations. Compared with traditional open surgery, this interventional surgery has the advantages of less trauma and faster recovery.
