### Report Overview

Stepwise projection exposure machine is an exposure device used in microelectronic manufacturing and semiconductor processes. It is used to manufacture microchips and integrated circuits by shining a light source on a mask and then projecting the pattern of the mask onto a photosensitive material. The working principle of a step-by-step projection exposure machine is as follows: Prepare a mask: Firstly, the manufacturing personnel need to prepare a mask that contains the pattern to be copied on the photosensitive material. Masks are usually made of glass or quartz material, coated with photoresist or photoresist. Alignment and exposure: The photosensitive material (usually silicon wafer) is placed on the countertop of the exposure machine. The optical system between the mask and the light source amplifies the pattern on the mask and focuses the light onto the photosensitive material. By aligning and adjusting, ensure that the pattern of the mask corresponds to a specific area of the photosensitive material. Step by step exposure: The exposure opportunity is exposed in a step-by-step manner based on preset parameters and requirements. It will be exposed in a small area on the mask, and then move the tabletop or mask a short distance to expose again, repeating this process until the entire area of the photosensitive material is exposed. Pattern transmission: Through step-by-step exposure, the patterns on the mask are gradually transmitted to the photosensitive material, forming multiple repeated patterns. These patterns can be circuits, transistors, capacitors, etc. of microchips. The step-by-step projection exposure machine has the characteristics of high precision, high efficiency, and repeatability, suitable for large-scale production and high-precision microelectronics manufacturing. It is widely used in fields such as integrated circuits, flat panel displays, optical devices, and has made important contributions to the development of the microelectronics industry.
