Abstracts

Stereoscopic imaging systems refer to technologies designed to capture, process, and display three-dimensional visual information by presenting slightly different images to each eye, thereby creating the perception of depth. These systems rely on methods such as dual-lens setups, active shutter glasses, polarized filters, or autostereoscopic displays (like lenticular lenses) to achieve the stereoscopic effect. Applications span industries including medical imaging (e.g., surgical guidance and diagnostics), entertainment (3D films and gaming), industrial design (CAD visualization and prototyping), defense (simulation and surveillance), and scientific research (geospatial analysis and microscopy). The core value proposition lies in enhancing spatial understanding, improving precision in tasks requiring depth perception, and offering immersive user experiences.

The global Stereoscopic Imaging System market size was estimated at USD 1250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
