Report Overview

Stereotactic Radiosurgery (SRS) is a non-invasive radiation therapy technique that delivers precisely targeted radiation at a single high dose to a specific area of the brain. It is primarily used to treat brain tumors and other neurological conditions with remarkable precision while minimizing radiation exposure to surrounding healthy tissue. SRS is typically performed in a single session, making it a convenient treatment option for patients who may not be suitable candidates for traditional surgery. This advanced technology has revolutionized the field of neurosurgery by offering a less invasive alternative with fewer side effects and shorter recovery times.

The market for Stereotactic Radiosurgery (SRS) is experiencing significant growth driven by several key factors. One of the primary market trends is the increasing incidence of brain tumors and neurological disorders worldwide, leading to a growing demand for advanced treatment options like SRS.
