Report Overview

Sterile active pharmaceutical ingredients have drastically improved the standards of medical treatment. These active pharmaceutical ingredients (APIs) are highly effective in small doses, and require sophisticated manufacturing facilities and specialized technical capabilities. Numerous APIs are sterilized unless the final dosage form is terminally sterilized or produced by a process including a sterilizing filtration step. APIs anticipated for usage in injectable products need to stringently comply with relevant specifications on pyrogens or bacterial endotoxins. The manufacture of sterile APIs is stringently controlled in order to minimize the risk of contamination with micro-organisms, endotoxins, and particles. If the final dosage form is not to be sterilized by filtration, the APIs should be practically free of particles. Sterile dry powder APIs are achieved generally by freeze drying process (lyophilisation or cryodesiccation), which ensures product stability and improved shelf-life of products destined for clinical or commercial applications.
