Abstracts

A stick curtain wall system is a non-structural, exterior cladding method consisting of individual vertical and horizontal framing members (mullions and transoms) assembled piece by piece on-site, typically using aluminum extrusions, with infill panels such as glass, metal, or stone installed into the framework. This system is distinct from unitized curtain walls, which are prefabricated in large sections off-site; stick systems offer greater flexibility for complex geometries, easier transportation of materials, and adaptability to existing structures, but require longer on-site labor and are more weather-dependent during installation. Commonly used in mid-rise to high-rise commercial, institutional, and residential buildings, stick curtain walls provide design versatility, natural light penetration, weather resistance, and thermal performance while allowing for customization in aesthetics and performance specifications.

The global Stick Curtain Wall System market size was estimated at USD 9550.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.70% during the forecast period.
