Abstracts

A stirred mill, also known as a stirred grinder, is a mill with grinding media. It drives the grinding media to stir through the stirring shaft, so that the grinding media is in an irregular state of internal porous type. In this state, collision and shearing, as well as irregular movement, occur between the grinding media and the particles, thereby breaking up the particles to achieve the purpose of refinement. The working principle of the stirred mill is mainly based on impact force and tangential shear force. The stirring shaft drives the grinding media to stir at high speed in the cylinder, forming a dynamic porous state, that is, an irregular state of internal porous type. In this state, strong collision and shearing, as well as irregular movement, occur between the grinding media and the particles, thereby achieving effective crushing of the particles.

The global Stirring Mill market size was estimated at USD 3113.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.10% during the forecast period.
