Abstracts

Strain Gauge Type six Axis Force Sensors usually uses strain gauge to measure the deformation of the elastic element where it is attached, and uses the corresponding force/torque conversion formula (deformation converted into resistance change) and the constructed bridge circuit to establish the relationship between the electrical signal output by the sensor and the torque value, thereby determining the output torque of the robot joint. According to the classification of strain gauges, strain sensors can be divided into metal resistance strain gauges (tool steel, stainless steel, aluminum alloy or beryllium copper, etc.) or silicon (semiconductor) strain gauge force sensors. Compared with metal strain gauge sensors, semiconductor strain gauge sensors have the advantages of high sensitivity coefficient (about 50-100 times higher), small mechanical hysteresis, small size (several orders of magnitude smaller than metal strain gauge sensors), and low power consumption.

The global Strain Gauge Type six Axis Force Sensors market size was estimated at USD 224.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 37.50% during the forecast period.
