Abstracts

A stratospheric airship is an airship that can fly in the stratosphere. It mainly relies on air buoyancy to rise and can fly for a long time in a quasi-stationary state at this altitude. As a type of near-space aircraft, stratospheric airships have unique flight characteristics and application prospects. Stratospheric airships fly in the stratosphere 20km to 100km above the ground. This altitude range belongs to near-space and has the characteristics of relatively stable airflow, low atmospheric density, low ambient temperature, and small flight Reynolds number. Stratospheric airships can maintain a quasi-stationary state in the stratosphere for a long time, which has significant advantages for long-term communication support, intelligence collection, electronic suppression, early warning and other tasks. Stratospheric airships can carry a certain scale of payload, which makes it more flexible and adaptable when performing various tasks.

The global Stratospheric Airship market size was estimated at USD 67.3 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.20% during the forecast period.
