Abstracts

Streaming Media Server is a dedicated server system based on network transmission protocol. Its core function is to distribute compressed and encoded audio and video data streams (such as H.264, H.265, AAC and other formats) to client devices in real-time or on-demand mode using streaming technology (such as RTMP, HLS, DASH). The essence of its technology is to play while transmitting, without the need for users to download the entire file. It adapts to different network bandwidths through a dynamic buffering mechanism and supports adaptive bit rate (ABR) switching to optimize the playback experience. For example, in a video on demand scenario, the server slices the pre-stored media files into small segments (such as TS segments), and the client selects the appropriate bit rate segment for download and playback based on the real-time network conditions; in a live broadcast scenario, the server receives the audio and video streams pushed by the encoder in real time, and transmits them to the audience synchronously through a distribution network (such as CDN).

The global Streaming Media Server market size was estimated at USD 12920.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.90% during the forecast period.
